Operational Wargaming

Advanced Training - 1 day

About:

Operational wargaming is designed to prepare operations teams for managing production Kubernetes clusters.

Participants are divided into teams and provided with their own GKE cluster running their mission critical service; through a series of scenarios based on real-world issues tackled by Jetstack and our customers, the clusters are subjected to changes affecting the availability of this service and teams will battle it out to see who can fix the issue fastest!

After each scenario, participants are presented with a detailed diagnosis of the issue followed by a discussion of a number of related concepts.

Participant level:

This course is for those who operate a Kubernetes cluster as part of their job. You should be familiar with the various Kubernetes components and have a good understanding of a range of resource types.

- *"Jetstack wargaming gave validation of our decisions so far, ideas for improvements and a good test of our ability to support the infrastructure we've built. "*

- *"Had a really insightful day...just proves how important it is to have the operational tasks rehearsed!"*
